## R Packages

 [factoextra](#) [survminer](#) [ggpubr](#) [ggcorrplot](#) [fastqcr](#)

- [Default plot without guide specification](#)
- [Change the legend position for multiple guides](#)
- [Change the order for multiple guides](#)
- [Remove a legend for a particular aesthetic](#)

- [Infos](#)

The goal of this **R tutorial** is to describe how to change the **legend** of a graph generated using **ggplot2** package.

## Data

ToothGrowth data is used in the examples below :

```
# Convert the variable dose from numeric to factor variable
ToothGrowth$dose <- as.factor(ToothGrowth$dose)
head(ToothGrowth)
```

```
##      len supp dose
## 1   4.2   VC  0.5
## 2  11.5   VC  0.5
## 3   7.3   VC  0.5
## 4   5.8   VC  0.5
## 5   6.4   VC  0.5
## 6  10.0   VC  0.5
```

Make sure that the variable *dose* is converted as a factor variable using the above R script.

## Example of plot

```
library(ggplot2)
p <- ggplot(ToothGrowth, aes(x=dose, y=len, fill=dose)) +
```

Our Books

```
geom_boxplot()
```

p

## Change the legend position

The position of the legend can be changed using the function `theme()` as follow :

```
p + theme(legend.position="top")  
p + theme(legend.position="bottom")
```

Practical Guide to Cluster  
Analysis in R

**3D Plots in R**

✓ The allowed values for the arguments **legend.position** are : "left", "top", "right", "bottom".

Note that, the argument **legend.position** can be also a numeric vector  $c(x,y)$ . In this case it is possible to position the legend inside the plotting area.  $x$  and  $y$  are the coordinates of the legend box. Their values should be between 0 and 1.  $c(0,0)$  corresponds to the "bottom left" and  $c(1,1)$  corresponds to the "top right" position.

```
p + theme(legend.position = c(0.8, 0.2))
```

## Change the legend title and text font styles

```
# legend title
p + theme(legend.title = element_text(colour="blue", size=10,
                                       face="bold"))

# legend labels
p + theme(legend.text = element_text(colour="blue", size=10,
                                       face="bold"))
```

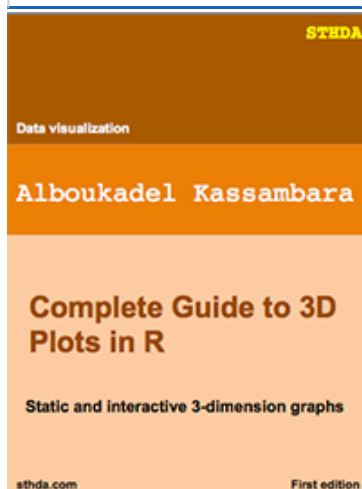

## Change the background color of the legend box

```
# legend box background color
p + theme(legend.background = element_rect(fill="lightblue",
                                           size=0.5, linetype="solid"))

p + theme(legend.background = element_rect(fill="lightblue",
                                           size=0.5, linetype="solid",
                                           colour = "darkblue"))
```

## Change the order of legend items

To change the order of items to "2", "0.5", "1" :

```
p + scale_x_discrete(limits=c("2", "0.5", "1"))
```

## Remove the plot legend

```
# Remove only the legend title
p + theme(legend.title = element_blank())
# Remove the plot legend
p + theme(legend.position='none')
```

## Remove slashes in the legend of a bar plot

```
# Default plot
ggplot(data=ToothGrowth, aes(x=dose, fill=dose)) + geom_bar()
# Change bar plot border color,
# but slashes are added in the legend
ggplot(data=ToothGrowth, aes(x=dose, fill=dose)) +
  geom_bar(colour="black")
# Hide the slashes:
#1. plot the bars with no border color,
#2. plot the bars again with border color, but with a blank legend.
ggplot(data=ToothGrowth, aes(x=dose, fill=dose))+
  geom_bar() +
  geom_bar(colour="black", show_guide=FALSE)
```

## guides() : set or remove the legend for a specific aesthetic

It's possible to use the function **guides()** to set or remove the legend of a particular aesthetic(fill, color, size, shape, etc).

*mtcars* data sets are used :

```
# Prepare the data : convert cyl and gear to factor variables
mtcars$cyl<-as.factor(mtcars$cyl)
mtcars$gear <- as.factor(mtcars$gear)
head(mtcars)
```

```
##           mpg  cyl  disp  hp  drat    wt    qsec  vs  am  gear  carb
## Mazda RX4      21.0    6   160  110  3.90  2.620  16.46  0   1     4     4
## Mazda RX4 Wag  21.0    6   160  110  3.90  2.875  17.02  0   1     4     4
## Datsun 710     22.8    4   108   93  3.85  2.320  18.61  1   1     4     1
## Hornet 4 Drive  21.4    6   258  110  3.08  3.215  19.44  1   0     3     1
## Hornet Sportabout 18.7    8   360  175  3.15  3.440  17.02  0   0     3     2
## Valiant        18.1    6   225  105  2.76  3.460  20.22  1   0     3     1
```

## Default plot without guide specification

The R code below creates a scatter plot. The color and the shape of the points are determined by the factor variables *cyl* and *gear*, respectively. The size of the points are controlled by the variable *qsec*.

```
p <- ggplot(data = mtcars,  
  aes(x=mpg, y=wt, color=cyl, size=qsec, shape=gear))+  
  geom_point()  
# Print the plot without guide specification  
p
```

## Change the legend position for multiple guides

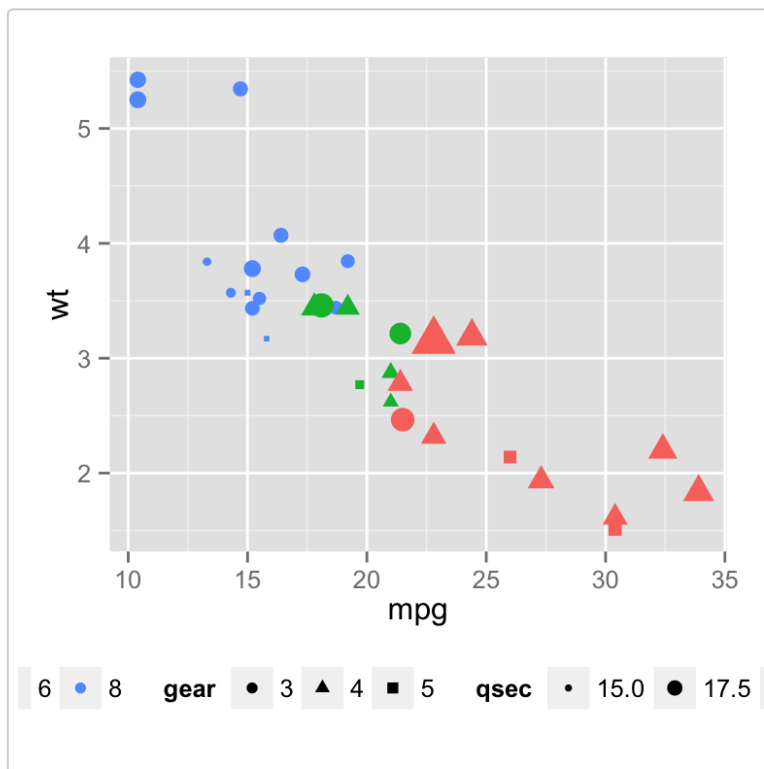

```
# Change the legend position  
p +theme(legend.position="bottom")
```

```
# Horizontal legend box  
p +theme(legend.position="bottom", legend.box = "horizontal")
```

## Change the order for multiple guides

The function **guide\_legend()** is used :

```
p+guides(color = guide_legend(order=1),  
         size = guide_legend(order=2),  
         shape = guide_legend(order=3))
```

If a *continuous color* is used, the order of the *color guide* can be changed using the function `guide_colourbar()` :

```
qplot(data = mpg, x = displ, y = cty, size = hwy,
       colour = cyl, shape = drv) +
  guides(colour = guide_colourbar(order = 1),
         alpha = guide_legend(order = 2),
         size = guide_legend(order = 3))
```

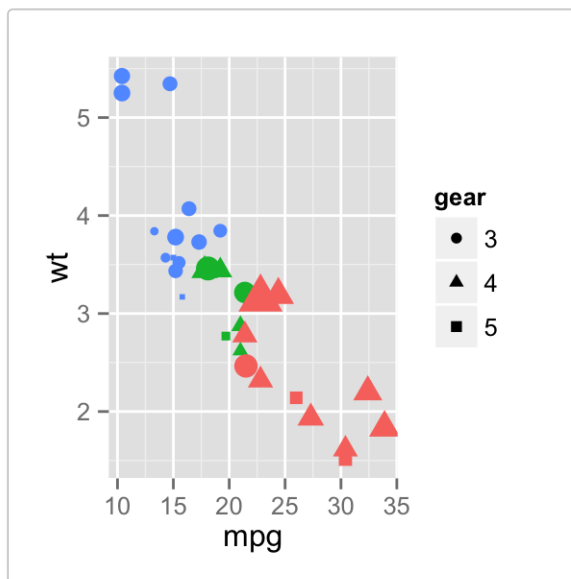

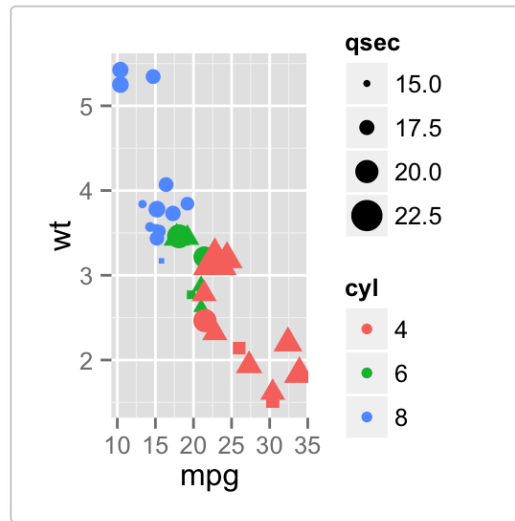

## Remove a legend for a particular aesthetic

The R code below removes the legend for the aesthetics color and size :

```
p+guides(color = FALSE, size = FALSE)
```

## Infos

This analysis has been performed using **R software** (ver. 3.1.0) and **ggplot2** (ver. 1.0.0)
